

IMPROVEMENTS TO ANALYSIS METHODS FOR INDIVIDUAL GENOTYPING

ABSTRACT OF THE DISCLOSURE

A method and data processing apparatus for determining the genotype of at
5 least one individual from a genetic marker using at least one measure of the amount of an
allele of the genetic marker that the individual are described. The method assigns the
measure of the amount of an allele to a group, a genotype is then assigned to the group and
the individual is determined to have the genotype assigned to the group.
